

Case Study Brief: Climate Trends & Modern Family Planning Access in Rwanda

Topic Area: Climate Resilience x Sexual & Reproductive Health and Rights (SRHR)

Data Sources: UNICEF Global SDG 3.7.1 Indicator Data & World Bank Climate Change Indicators

1. Overview & Objective

This desk research visualizer examines the relationship between environmental land-use factors and access to modern family planning services in Rwanda between 2010 and 2024. The objective is to evaluate whether national reproductive healthcare delivery remained consistent alongside agricultural land-use pressures.

2 The Problem -

- **Heavy Reliance on Farming:** Around 80% of Rwanda's land is used for farming. When floods, droughts, or bad weather happen, rural families face immediate financial and food problems.
- **Trouble Reaching Clinics:** Bad weather and damaged roads make it harder for people—especially young women—to travel to health clinics for basic healthcare.
- **The Main Question:** Can a country keep expanding family planning access even while dealing with climate and land challenges?

Goal of This Project To see how family planning access changed in Rwanda between 2010 and 2024 alongside agricultural land use, using reliable public data.

3. Key Visual Findings

Steady Rise in Healthcare Coverage: The percentage of women (aged 15–49) whose demand for family planning is satisfied with modern methods grew consistently from ~60% to over 72% across survey cycles.

- **Sustained Agricultural Pressure:** World Bank indicators show agricultural land use remained steady at ~79.7% of total land area, reflecting continuous resource dependency.

- **Service Resilience:** Despite high land utilization and environmental fluctuations, family planning service delivery showed strong continuity, indicating effective decentralized public health outreach.

4. Practical Solutions

- **Local Health Workers:** Support local village health workers to deliver family planning supplies directly in communities, so people don't have to travel far during heavy rains.
- **Stock Supplies Early:** Store extra medicines and family planning supplies at local health centers before rainy seasons to prevent shortages.
- **Simple Phone Services:** Use basic SMS text messages to share health advice and clinic hours with youth who cannot visit in person.

5. How the Data Was Handled

- Downloaded simple CSV data files from UNICEF and the World Bank.
- Cleaned the tables, removed empty rows, and fixed dates using Power Query.
- Built a clear chart in Power BI comparing land use and healthcare trends side-by-side.
- Checked numbers carefully against official reports to ensure 100% accuracy.

6. Why This Fits the YLabs Role

- Finding reliable facts and data online.
- Turning raw numbers into clear, simple charts.

- Writing short, easy-to-read reports and summaries.
